1. INTRODUCTION

This report presents the results of an energy audit performed under the Energy Engineering Analysis Program (EEAP) for three permanent Dining Facilities at Fort Rucker, Alabama, specifically buildings 4501, 4508 and 5914. Temporary buildings 3914 and 3915 were originally included in this energy audit. In accordance with ECIP guidance, documentation was requested from the base showing a minimum 10 year continuing need for these buildings. No documentation was provided. In addition, the function of these two buildings has changed from that of dining facilities to classroom facilities. In view of this, buildings 3914 and 3915 are not included in the report.

The study included on-site investigation, engineering analysis and produced recommendations for project implementation. All of the Energy Conservation Opportunities listed in the ECO checklist (Figure ES-1, page ES-8) were considered in accordance with the scope of work. Other Energy Conservation Opportunities were added to the original ECO checklist as they were discovered.

This report is organized into three separate volumes and an executive summary.

Volume I includes the following five sections.

Section 1 describes the general features of the energy study, the scope of work and the methods of approach used to accomplish the work.

Section 2 provides a general description of the present conditions of the facilities considered in this EEAP study. In addition, site maps, building floor plans, photographs and other pertinent information is included.

Section 3 summarizes prior energy studies for energy conservation opportunities investigated, recommended and documented.

Section 4 describes methods of analysis used to evaluate the energy conservation opportunities.

Section 5 contains the recommendations and conclusions of the energy audit investigation.

Appendix A provides a copy of the the energy audit scope of work.

Volume II includes a description of projects considered and corresponding calculations. This volume is organized first, by the specific dining facility, then by the discipline involved and finally by the ECO project number.

Volume III, Appendix B, includes the required project documentation.

2. DESCRIPTION OF FACILITIES

ARCHITECTURAL

The three dining facilities are of brick veneer/concrete block wall construction with concrete floor slabs and built-up roofs on steel trusses. Ceilings are suspended. Windows in the dining areas constitute a significant portion of the total wall area. The windows are metal frame awning type with clear single glazing. Each window has a porcelainized panel at the top. A crawl space is provided below the kitchen service areas only. Typical building construction data is provided in Table ES-1 (page ES-5).

MECHANICAL

The kitchen, food preparation and staff support areas are heated and ventilated only. The dining, food service and cloak room areas are heated and cooled by a mechanical system separate from the kitchen heat and vent units. Chilled water is supplied by large air cooled chillers. Steam is used both for space heating and domestic hot water generation. Air curtains are utilized at the vestibule entrances and at the kitchen exterior doors.

Each building is connected to the basewide EMCS system. At the time of the survey many of the EMCS points were in alarm status or deleted.

ELECTRICAL

Lighting, in general, is a combination of fluorescent and incandescent. Incandescent lighting is used in the dining, entry foyer and food service areas and fluorescent lighting in the kitchen and food prep areas. Fluorescent fixtures have standard core type ballasts.

UTILITY SERVICES

Each building is equipped with water, steam, electricity and gas from the Fort Rucker basewide distribution systems.

TABLE ES-1
TYPICAL BUILDING CONSTRUCTION DATA
BUILDINGS 4501, 4508 AND 5914

<u>COMPONENT</u>	<u>LOCATION</u>	<u>CONSTRUCTION FEATURES</u>
FLOOR	FOYER	5" CONCRETE SLAB ON GRADE, W.P. MEMBRANE, V.A. TILE, NO INSULATION.
	DINING	5" CONCRETE SLAB ON GRADE, W.P. MEMBRANE, V.A. TILE, NO INSULATION.
	FOOD PREP & SERVING	6" STRUCTURAL CONCRETE SLAB ON PIERS, 3 FT CRAWL SPACE, NO INSULATION, TILE FLOOR.
MEZZANINE	KITCHEN	7" STRUCTURAL CONCRETE SLAB ON COLUMNS, NO INSULATION.
CEILING	FOYER	SUSPENDED ACOUSTICAL CEILING, NO INSULATION.
	DINING	SUSPENDED ACOUSTICAL CEILING, INSULATION.
	KITCHEN	CEMENT PLASTER ON METAL LATH ATTACHED TO STEEL FRAME, INSULATED.
ROOF	FOYER	BUILT-UP, METAL DECK, STEEL BAR JOISTS, RIGID INSULATION.
	DINING	BUILT-UP, METAL DECK, STEEL TRUSS FRAME, RIGID INSULATION.
	KITCHEN	BUILT-UP, METAL DECK, STEEL TRUSS FRAME, RIGID INSULATION.
WALLS	FOYER	BRICK ON CONCRETE BLOCK, CAST STONE TREATMENT, NO INSULATION.
	DINING	BRICK ON CONCRETE BLOCK, NO INSULATION
	KITCHEN	BRICK ON CONCRETE BLOCK, NO INSULATION
WINDOWS	FOYER	FIXED SINGLE CLEAR GLASS WITH PORCELAIN OR CAST STONE PANELS.
	DINING	SINGLE CLEAR GLASS WITH PORCELAIN OR CAST STONE PANELS.
	KITCHEN	SINGLE CLEAR GLASS.
DOORS	EXTERIOR	METAL HOLLOW CORE, 50% GLASS, PLATE OR WIRE REINFORCED.

3. PROJECT APPROACH

The field survey was accomplished by a multi-discipline team from the Engineering Division at the Mobile District. Milestones for the dining facilities energy audit were established and a project schedule was developed. They are as follows:

Mobilization and Development Planning.

Initial Site and Fieldwork at Base Facilities.

Interim Report and Energy Projects Identification.

Follow-up Fieldwork at Base Facilities.

Pre-final Report and Recommended Projects Documentation.

Final Report and Projects Documentation.

Selections for the study team were based on the ECO task distribution given on the checklist provided with the scope of work. The field study team consisted of three journeyman level and two senior level engineers and a team leader. Each team member was provided with available information on assigned tasks prior to the actual site visits. Recommended ECO's provided on the checklist were grouped by discipline for investigation and project development. For discipline grouping refer to the ECO checklist shown in Figure ES-1 (page ES-8).

Upon arrival at the site, a meeting was held with the DEH and his utility/energy staff to discuss specific requirements for gathering field data, to coordinate activities and to introduce the study team

to the staff. Areas of potential energy savings opportunities were discussed in order to plan strategy and procedures. Each ECO was investigated by team members in accordance with the checklist provided. Data was collected by direct investigation and measurement. Photographs were also made of each to use on the development of projects. Available construction drawings were obtained for in depth evaluation and analysis of applicable ECO's.

4. PRESENT ENERGY CONSUMPTION

Actual energy consumption for the dining facilities has been unmetered and/or unrecorded in the past. Therefore, energy uses and consumption were developed using a computer model generated by BLAST (Building Loads Analysis and System Thermodynamics) version 3.0. The present energy consumption is estimated to be 7379 MBTU/year each for buildings 4501 and 4508 and 7855 MBTU/year for building 5914. This is demonstrated graphically in the pie chart shown in Figure ES-2 (page ES-10). Based on the above energy consumption and the energy unit cost factors (Table ES-2, page ES-11) the annual energy cost is \$30,368 each for buildings 4501 and 4508 and \$32,534 for building 5914.

PRESENT ENERGY CONSUMPTION (MBTU/YEAR)
FIGURE ES-2

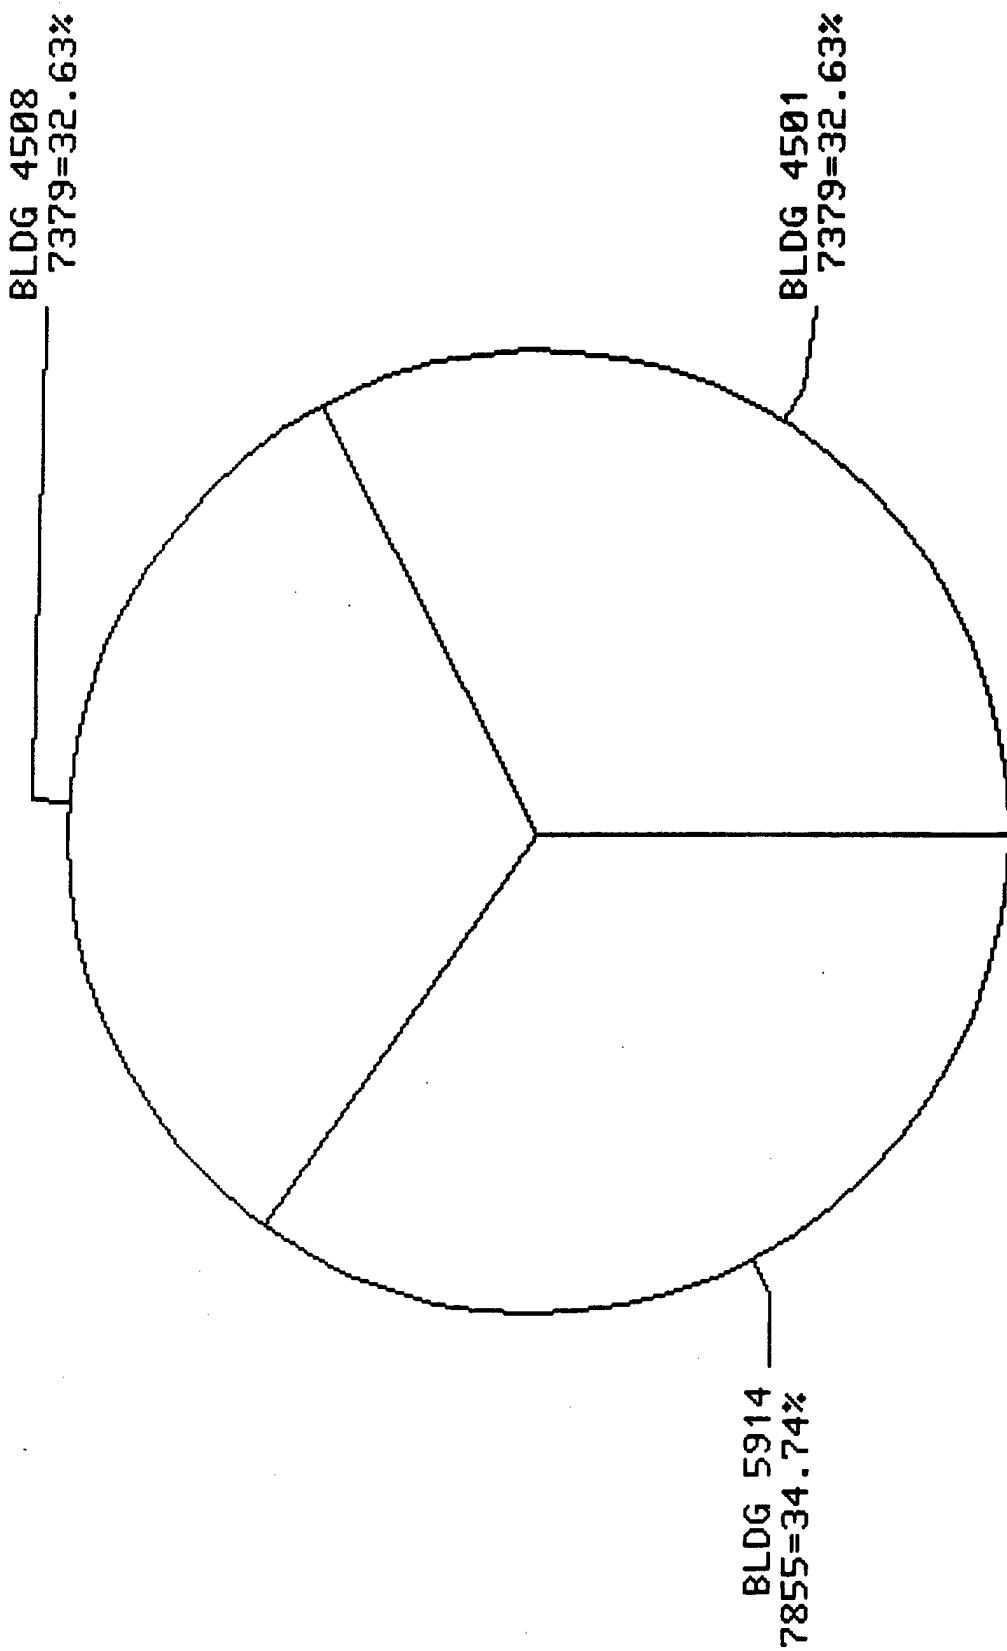

TABLE ES-2
ANNUAL ENERGY CONSUMPTION
FOR DINING FACILITIES

BUILDINGS 4501 AND 4508

<u>ENERGY TYPE</u>	<u>MBTU **</u>	<u>DOLLARS</u>
ELECTRICITY	4,333	\$16,509
GAS	3,046	\$13,859
TOTALS	7,379 *	\$30,368 *

BUILDING 5914

<u>ENERGY TYPE</u>	<u>MBTU **</u>	<u>DOLLARS</u>
ELECTRICITY	4,333	\$16,509
GAS	3,522	\$16,025
TOTALS	7,855	\$32,534

DERIVATION OF ENERGY UNIT COST FACTORS

1. UNIT COST BY ITEM: ***

PURCHASED ELECTRICAL POWER - \$0.0442/KWH
 NO 2 FUEL OIL (DISTILLATE) - \$0.95/GAL
 NO 5 FUEL OIL (RESIDUAL) - \$0.80/GAL
 NATURAL GAS - \$4.69/MCF

2. UNIT COST PER MBTU:

PURCHASED ELECTRICAL POWER- $(\$0.0442)(1 \times 10^6)/11,600 = \$3.81/\text{MBTU}$
 NO 2 FUEL OIL (DISTILLATE)- $(\$0.95)(1 \times 10^6)/138,700 = \$6.84/\text{MBTU}$
 NO 5 FUEL OIL (RESIDUAL) - $(\$0.85)(1 \times 10^6)/148,000 = \$5.74/\text{MBTU}$
 NATURAL GAS - $(\$4.69)(1 \times 10^6)/1,031,000 = \$4.55/\text{MBTU}$

NOTE: * Per building.

** Energy consumption figures are based on BLAST 3.0 simulations.

*** Energy costs listed are actual figures extracted from base records.

5. CONCLUSIONS AND RECOMMENDATIONS

Table ES-4 (page ES-18) lists all projects considered. Annual energy savings, annual dollar savings, simple payback in years, SIR and total contract costs are all listed in this table. A brief explanation is given for those projects rejected without engineering evaluation. The projects are ranked according to SIR, from highest to lowest.

Table ES-3 (page ES-15) is a condensed ECO summary that lists only those projects used to compile the information which determined the total energy savings. Total dollar savings per year and total contract costs are listed as well. The combined energy savings for all three buildings are 5,690 MBTU/year. The combined dollar savings are \$26,123 per year. The total annual energy consumption was reduced from 22,613 MBTU to 16,923 MBTU (a 25 percent reduction). This is demonstrated graphically in the pie chart representation of energy savings (Figure ES-3, page ES-14).

Some overlap occurred in savings with regard to projects 20.1, 20.2, 33.2, and 38. Each of these projects incorporated the use of "reduced ventilation air" to achieve energy savings. To rectify this situation, project 38, "Reduce Outside Air Quantity", was chosen to represent the savings associated with reducing ventilation air quantities. Although projects 20.1, 20.2 and 33.2 were not

included in the total energy savings they remain recommended as individual energy conservation opportunities.

Volume III includes all project documentation required in the Scope of Work. There were three Quick Return on Investment Program (QRIP) projects and 33 Low Cost/No Cost Projects recommended for implementation.
